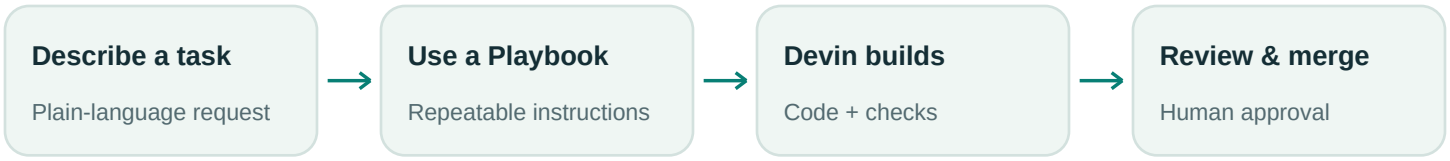
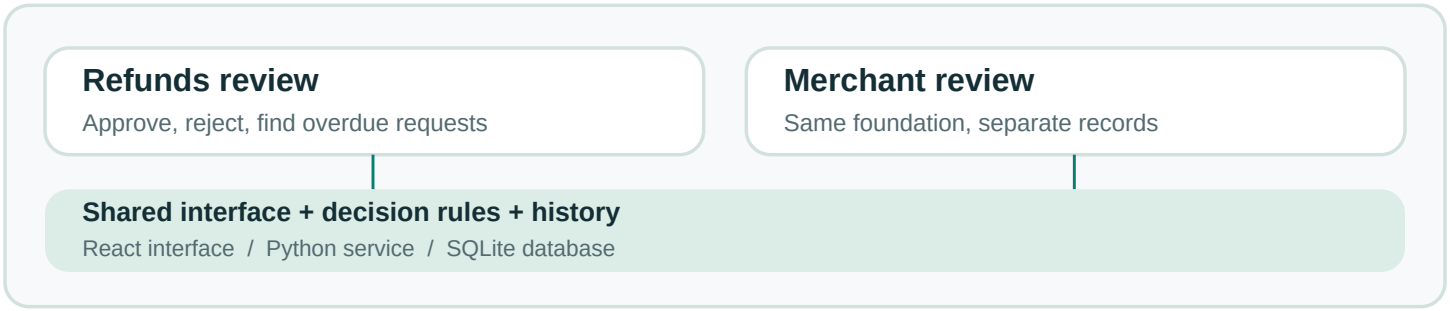
Make the next tool easier.

I built a refunds queue, changed it in a fresh Devin session, then reused it for merchant reviews. The real test was whether the second task became easier.

01 THE CHANGE WORKFLOW



02 THE APP WE BUILT



WHY I CHOSE THIS SCOPE

1. **Start with one real workflow.**
   Refunds exercise search, decisions and history in one small app. I saved the overdue filter for a later session to test maintenance as well as creation.

2. **Reuse the foundation.**
   Merchant reviews reuse the same screens and rules, with separate records. That avoids maintaining copies, but a shared change can affect both tools.

3. **Keep a person in the loop.**
   Playbooks guide Create, Update, Variant and Health tasks. The update needed a publishing handoff, and automatic triggers were not conclusively proven.

A useful prototype. Still a production gap.

Synthetic data and selectable demo roles kept the build small. Real sign-in, protected audit records, reliable hosting and backups still need engineering. The later Devin security profile needs a clean enforcement test; it does not secure the app itself.

My next step: keep Power Apps and pilot one low-risk, read-only tool before deciding whether the ongoing ownership cost is worth it.

Checked: 26 backend tests + frontend checks + browser walkthroughs.

Devin built the app; Codex assisted orchestration, review and presentation.
